Priority level map

When a new report becomes Low, Medium or High - the rules currently in Components/PriorityScore.php

How the level is set

score = 0.40 x urgency + 0.25 x facility importance + 0.20 x age + 0.15 x recurrence. Each term runs from 1 to 3.

- **Urgency** is held at Medium (2) when a report is submitted, because the reporter does not choose one.
- **Facility importance**: 3 = records, lab, secretary, server rooms; 2 = offices and halls (and anything that matches nothing); 1 = hallway, storage, covered court. The **room name is checked first**, then the facility name.
- **Age**: days since the date reported, capped at 10 days (1 point at 0 days, 3 points at 10 days).
- **Recurrence**: earlier reports of the same equipment in the last 30 days, capped at 3 (1 point at none, 3 points at three).
- **Level**: **High** at 2.20 or more, **Medium** at 1.60 or more, **Low** below 1.60.

Each cell shows the level and the score. "Earlier reports" means the same equipment was already reported that many times in the last 30 days. "Backdated" means the reporter picked a date that many days ago.

What the map shows

- The room name decides the level, not which hall it is. Barangay Hall and Multi-Purpose Hall score the same in the same kind of room.
- Barangay Hall is not weighted higher. An Office 2 report is Medium in both halls, and a Hallway or Storage Room report can be Low in either.
- Equipment type is not part of the score. A computer or printer report scores the same as a door report in the same room.
- High is rare. Secretary, Records and Server rooms reach it after 3 earlier reports of the same equipment or a 10-day backdate. Offices and other 2-point rooms need both a 10-day backdate and 2 or more earlier reports. Hallway, storage and covered court never reach High.
- The level is set once, when the report is submitted. Waiting time afterwards does not change the label.
- Facility and room names above are examples from the current data; any other name that matches no keyword counts as 2 points.
